

Subarray Division [Problem](#) | [Submissions](#) | [Leaderboard](#) | [Discussions](#) | [Editorial](#) 

Two children, Lily and Ron, want to share a chocolate bar. Each of the squares has an integer on it.

Lily decides to share a contiguous segment of the bar selected such that:

- The length of the segment matches Ron's birth month, and,
- The sum of the integers on the squares is equal to his birth day.

Determine how many ways she can divide the chocolate.

Example

$s = [2, 1, 1, 3, 2]$

$d = 4$

$m = 2$

Lily wants to find segments summing to Ron's birth day, $d = 4$ with a length equaling his birth month, $m = 2$. In this case, there are two segments meeting her criteria: $[2, 2]$ and $[1, 3]$.

Function Description

Complete the birthday function in the editor below.

birthday has the following parameter(s):

- `int s[]`: the numbers on each of the squares of chocolate
- `int d`: Ron's birth day
- `int m`: Ron's birth month

Returns

- `int`: the number of ways the bar can be divided

Input Format

The first line contains an integer n , the number of squares in the chocolate bar.

The second line contains n space-separated integers $s[i]$, the numbers on the chocolate squares where $0 \leq i < n$.

The third line contains two space-separated integers, d and m , Ron's birth day and his birth month.

Constraints

- $1 \leq n \leq 100$
- $1 \leq s[i] \leq 5$, where $0 \leq i < n$
- $1 \leq d \leq 31$
- $1 \leq m \leq 12$

Sample Input 0

```
5
1 2 1 3 2
3 2
```

Sample Output 0

```
2
```
